Lecture#20: Digital-to-Analog Converter (DAC)

Chapter 21

Summer, 2023

Mohammad A. Qayum, Ph.D.
ECE, NSU, Dhaka, Bangladesh

Digital-to-analog converter (DAC)

- Converts digital data into a voltage signal by a N-bit DAC

$$DAC_{output} = V_{ref} \times \frac{Digital\ Value}{2^N}$$

- For 12-bit DAC

$$DAC_{output} = V_{ref} \times \frac{Digital\ Value}{4096}$$

- Many applications:
 - digital audio
 - waveform generation
- Performance parameters
 - speed
 - resolution
 - power dissipation

DAC Implementations

- Pulse-width modulator (PWM)
- Binary-weighted resistor (We will use this one as an example)
- R-2R ladder (A special case of binary-weighted resistor)

Binary-weighted Resistor DAC

$$V_{out} = V_{ref} \times \frac{R_{ref}}{R} \times (D_3 \times 2^3 + D_2 \times 2^2 + D_1 \times 2 + D_0)$$

Buffered Output

□ Load Effect

$$V_{OUT} = \frac{R_{LOAD}}{R_{DAC} + R_{LOAD}} \times V_{OUT}^{desired}$$

Buffered Output

- Use buffer to remove load effect

$$V_{OUT} \approx V_{OUT}^{desired}$$

DAC Update

▣ DAC Output 1: PA.4

- ▶ PA.4 is connected to ground via a capacitor

▶ DAC Output 2: PA.5

- ▶ Connect to 3V via a small resistor

▶ In the lab, use DAC Output2 (PA.5)

▶ Have to clear CCIF or UIF flags in status register in Interrupt Service Handler

▶ ARR: CNT counts from 0 to ARR

$$\frac{f_{HSI}}{(1 + PSC)(1 + ARR)} = 44.1KHz$$

For a pitch p , its frequency f

$$f = 440 \times 2^{(p-69)/12}$$

Digital Music

Generate Sine Wave

$$\begin{aligned} &\sin(0.4014257) \\ &= 0.4014257 - 0.4014257^3/3! + 0.4014257^5/5! - 0.4014257^7/7! \\ &= 0.4014257 - 0.0107811296737492 + 0.000086864959350 - 0.000000333277256 \\ &= 0.390731102008345 \end{aligned}$$

floating-point operations

- No FPU available on the processor to compute sine functions
- Software FP to compute sine is slow
- Solution: **Table Lookup**
 - Compute sine values and store in table as fix-point format
 - Look up the table for result
 - Linear interpolation if necessary

Digital Music:

Attack, Decay, Sustain, Release (ADSR)

Implemented by a simple digital filter:

$$ADSR(n) = g \times \overrightarrow{ADSR} + (1 - g) \times ADSR(n - 1)$$

where $\overrightarrow{ADSR}$ is the target modulated amplitude value,
 g is the gain parameter.

Digital Music

ADSR Amplitude Modulation
